READ THIS

The structure of the *Catalog of Infrared Observations* is unconventional and should not be confused with more traditional catalog formats. Please note the following special characteristics.

1) **Sky coverage is not uniform.** The catalog data is a mixture of sky surveys, small-scale region surveys, and numerous individual source observations. The whole sky has been surveyed only at a few specific wavelengths. Non-survey observations are highly selective.

2) **Data are presented in original published form.** The Catalog is a summary of all infrared astronomical observations published in the international scientific literature. No attempt has been made to create a single system of infrared photometric units, or to eliminate redundant observations. This kind of interpretation is more appropriately the responsibility of the individual researcher.

3) **The Catalog is as accurate as the published data** from which it was constructed. Observations listed here were made by hundreds of investigators, using different instrumental techniques and methods of analysis.

The user of this catalog must therefore approach it with the same kind of professional skepticism which would be applied to the original journal articles.

Inquiries and comments regarding the contents of the catalog, and requests for copies of the catalog and data base in printed, microfiche, or magnetic tape form should be directed to:

HOW TO USE THIS CATALOG

1) **Sources are listed by position:** The catalog observations are arranged in order of increasing right ascension, then declination, then by the wavelength of the observation, **not** by source name. If you do not have the position of a source, find it in the *Index of Infrared Source Positions* (arranged alphabetically by source name) in Part II.

2) **Infrared and "nominal" positions:** The catalog lists published source positions, and also "nominal" positions. When the original articles do not specify the observed infrared positions (for well-known visible objects, for example), the positions listed are taken from a variety of standard catalogs. The nominal positions given are the best available, but not a published infrared observational result.

3) **Multiple source positions:** Check nearby positions on the page. Very often the same source is listed at several different positions in the catalog (because observers report different positions, or because positions are published with differing precision).

4) **Multiple source names:** The same source is often listed under several different names in the catalog (because it was renamed in several surveys, or by different observers). Check nearby source names for additional data on the source. The new *Infrared Source Cross-Index* (NASA RP 1182) can be used to easily locate source name aliases listed in the CIO.

5) **Accuracy of catalog data:** The catalog data are presented "as published" in the original articles. Always refer to the original article when interpreting catalog data listings. Use the bibliographic reference number given for each observation to identify the original journal article in the *Bibliography of Infrared Astronomy* in Part II. The Bibliography is also listed alphabetically by first author to aid the user in locating familiar journal articles.

CATALOG OF INFRARED OBSERVATIONS—1987 (SECOND EDITION)

1. Introduction

The Second Edition of the *Catalog of Infrared Observations (CIO)* differs from the First Edition (NASA RP 1118) in three significant ways: 1) IRAS (Infrared Astronomical Satellite) Point Source Catalog (PSC) identifications and fluxes have been added in the main catalog listings for all of the CIO sources detected by IRAS, 2) the CIO data base literature search has been updated, and the data base and Catalog are now complete for 1965 through 1986, and 3) the latest version of the Revised AFGL Survey Catalog has replaced the AFGL and AFGL Supplement data which appeared in the previous edition.

Because of its size, this edition is divided into two parts. Part I contains the main catalog listings, including two new columns of coded IRAS data applicable to each source. Part II contains five appendices: three familiar from the First Edition (the *Index of Infrared Source Positions,* and two versions of the *Bibliography of Infrared Astronomy,* organized chronologically and alphabetically by first author) as well as two new reference documents (*Atlas of Infrared Spectral Ranges,* and the *IRAS PSC Data for CIO sources).*

A new data product, the *Infrared Source Cross-Index* (NASA RP 1182), was recently published (April 1987) to facilitate use of the First Edition of the CIO. The Cross-Index lists all infrared source names and identifications (or aliases) by which infrared sources have been identified in the astronomical literature (including the relevant IRAS Survey identifications). Also, identifications were obtained by correlating source names and identifications made in the available machine-readable astronomical data bases (including visible, radio, etc.). This document was distributed to regular recipients of the CIO, and is also available by request to the authors.

2. The Goddard Infrared Astronomical Data Base

The *Catalog of Infrared Observations*, and the data base from which it is constructed, comprise a machine-readable library of infrared (1 μm - 1000 μm) astronomical observations published in the scientific literature from 1965 through 1986. The Goddard Infrared Astronomical Data Base, maintained at NASA/Goddard Space Flight Center, contains infrared observational data for astronomical sources outside the solar system constructed through a search of the most active scientific journals, infrared surveys, and catalogs (see Table 1). Journal articles are screened manually and cross-checked with the NASA/GSFC library RECON computer search system and the Astronomy and Astrophysics Abstracts under applicable keywords.

The data base is processed with the Goddard NASA Space and Earth Sciences Computer Center (NSESCC) IBM S3081 computer. A magnetic tape library contains all of the observational data, bibliographic reference information, object name aliases, and stellar catalogs (for supplementary position determinations). A library of FORTRAN language programs (used to access and process the data) and a file of journal article photocopies are maintained as part of the data base.

The current extent of the literature is summarized in Table 1. To date, about 2900 journal articles and 10 major survey catalogs have been included in this data base, which contains over 140,000 individual observations.

3. IRAS Data in the Second Edition

While it would be reasonable to include as much IRAS data as possible in the new data base, the large number of sources (245,000) in the IRAS Point Source Catalog (PSC) alone would clearly overwhelm the CIO. Thus, criteria had to be established to include IRAS PSC data without changing the basic nature of the CIO (i.e., an accessible data base of all published infrared astronomical observations). The final basis by which IRAS data was incorporated into the CIO was to include the IRAS PSC names, positions, and fluxes for those CIO sources detected by IRAS in the PSC Version 1.0. This provides the CIO user with accurate and easily accessible PSC data for all of the infrared sources published in the astronomical literature. The PSC name and four digit code summarizing the four IRAS band fluxes are given in two new columns in the main catalog listings (Part I). and complete PSC flux and position data are provided in Appendix E (Part II). When IRAS sources were subsequently observed by other means and the results published in the literature, the new observations appear under the IRAS name.

TABLE 1: LITERATURE INCLUDED IN THE DATA BASE

The Catalog contains observational data obtained from a search of the following infrared catalogs and scientific journals for the years 1965-1986, inclusive. The number of articles in each journal containing infrared astronomical data and the journal abbreviations used in the bibliography are indicated.

Scientific Journals Searched (1965 - 1986 complete):

220	Astronomical Journal (A.J.)
375	Astronomy and Astrophysics (Astr. & Ap.)
28	Astronomy and Astrophysics Supplement (Astr. & Ap. Suppl.)
904	Astrophysical Journal (Ap. J.)
457	Astrophysical Journal Letters (Ap. J. Letters)
41	Astrophysical Journal Supplement Series (Ap. J. Suppl.)
21	Astrophysical Letters (Ap. Letters)
13	Astrofizika
15	Communications of the Lunar and Planetary Laboratory (Comm. L.P.L.)
1	Earth and Extraterrestrial Sciences (Earth and Ext. Sci.)
56	I.A.U. Circulars (I.A.U. Circ.)
396	Monthly Notices of the Royal Astronomical Society (M.N.R.A.S.)
5	Monthly Notices of the Astronomical Society of South Africa (M.N.A.S.S.A.)
96	Nature and Nature Physical Sciences
8	Observatory
5	Proceedings of the Astronomical Society of Australia (Proc. A.S.A.)
34	Publications of the Astronomical Society of Japan (P.A.S.J.)
138	Publications of the Astronomical Society of the Pacific (P.A.S.P.)
36	Soviet Astronomy (Sov. Ast.)
25	Soviet Astronomy Letters (Sov. Ast. Letters)

Infrared Catalogs:

Infrared Astronomical Satellite (IRAS) Point Source Catalog (841103)
IRAS Small Scale Structure Catalog (851123)
Caltech Two-micron Sky Survey (690001)
Revised AFGL Four-Color Infrared Sky Survey Catalog (830610)
Equatorial Infrared Catalog (780604)
Far Infrared Sky Survey Experiment (830201)

Other Journals Searched (all years not complete):

Annals d'Astrofisca (Ann. d'Ast.)
Astrophysics and Space Sciences (Ap. and Sp. Sci.)
Chinese Astronomy (Chi. Ast.)
Comments on Astrophysics (Comm. on Ap.)
Memoirs of the Royal Astronomical Society (Mem. R.A.S.)
Science
Tokyo Astronomical Bulletin (Tokyo Ast. Bul.)
Zeitschrift fur Astrophysik (Zeit. fur Ap.)

The identifications of CIO with PSC sources were based on source identifications made in the IRAS Point Source Catalog, correlated infrared source names, and aliases in the *Infrared Source Cross-Index* data base.

About 11,500 of the individual infrared sources represented in this edition of the CIO were detected in the IRAS Point Source Survey. The PSC 12, 25, 60, and 100 micron fluxes are listed for these CIO sources in Appendix E.

4. Appendices to the Catalog

The *Index of Infrared Source Positions* (Appendix A), located in Part II of this catalog, is a listing of infrared source positions arranged alphabetically by source name. The position of a source can thus easily be found by knowing its name, and it can be quickly located in the Catalog. When published articles do not include the position of the observed source, the editors provide nominal positions obtained from other data bases. The nominal positions are the best available, but in a few cases may not coincide with the true infrared positions. The bibliographic reference from which the nominal position was obtained is indicated in the POSREF column. The reader is then referred to Appendix B for the full reference data.

The *Bibliography of Infrared Astronomy* links observations in the Catalog with the original articles published in the astronomical literature. Approximately 3170 infrared journal articles and other references are listed in this appendix. The Bibliography is arranged both chronologically (Appendix B) by reference number, and alphabetically (Appendix C) by first author. It contains the authors' names, journal name or document number, volume, page, and full title.

The *Atlas of Infrared Spectral Ranges* (Appendix D) is a new reference tool which summarizes the wavelength range over which spectra have been published for individual sources, since plotted spectra cannot be readily included in the automated data base. It lists the name, starting and ending wavelengths, and bibliographic reference number for each published infrared source spectrum.

The *IRAS PSC Data for CIO Sources* listing (Appendix E) gives the full IRAS Point Source Catalog name, position, and four-band flux data for all CIO sources listed in the PSC Version 1.0. Upper limit values are shown in italics. Moderate quality fluxes (as defined in the *Point Source Catalog)* are followed by a colon (:).

5. Definitions of the Catalog Column Headings

SOURCE NAME - "NAME": Frequently, an astronomical source is listed by several different names in the catalog, since the observations are listed "as given" by the original authors. In general, source names sould be given secondary importance when searching the catalog listings. Positions should be given highest priority. All source names and positions are cross-referenced in the *Index of Infrared Source Positions* (Apendix A). The source names are abbreviated (see Tables 3, 4, and 5), and in a few cases the names are augmented by the editors (for example, when the original author assigns the source a number but no identifying prefix). Source names are frequently composed of a catalog name abbreviation and some identifying number. A list of commonly used abbreviations and their meanings is given in Table 5. IRAS PSC entries are listed by their coordinate designations.

POSITION - "RA (1950) DEC": The accuracy of the positional data in the catalog reflects the nature of the original data published by the original author without specifying the source position. This is true primarily for visible sources with well documented positions. In such cases, a "nominal" source position is entered in the POSITION field by the editors. When authors omit specific source positions from their articles, they must presume that the position is common knowledge, to be found in the appropriate standard catalog. When no position is available to the editors, all such entires are sorted alphabetically by source name and are listed at the end of the catalog. Objects which can be located in a general area of the sky (e.g., individual stars around a globular cluster) are listed with a dash (–) in the position field. A nominal position for such objects is given above the dashed entries. Ditto marks are used to indicate identical positions on successive lines. Leading zeroes for hours of right ascension have been suppressed.

WAVELENGTH - "λ (μ m)": The wavelength of the observation is given in units of microns. Catalog entries having the same celestial position are listed in order of increasing wavelength. Thus, a rough spectral distribution appears for each well-observed source position. The "λ (μm)" column data can also be used as a visual indication of when the catalog changes to a new source, since the wavelength listing will "reset" to the lower value. Although the

*This column indicates the total number of journal articles using each unit.

inclusion criteria for the Goddard Infrared Astronomical Data Base specifies a wavelength range of from 1 - 1000 μm, some catalog entires have wavelengths outside this range. Wavelengths less than 1 μm would indicate that a spectrum exists in the article starting at this wavelength and extending into the infrared. A few wavelengths greater than 1000 μm have been included when it was felt by the authors that a significant portion of far infrared radiation was included in the observation. This is often true for large band-passes which would have the central wavelength listed in the catalog.

INFRARED FLUX - "FLUX": The observed infrared flux is listed in the same units as published by the original authors. The units have been given arbitrary one-letter abbreviations (see Table 2). To protect the integrity of the data base, no attempt has been made to convert the many different units of infrared flux found in the catalog into a more homogeneous system. *Upper limits are listed in italics.* About 95% of the flux observations in the catalog have units of "magnitudes" or "Janskys", or are comments such as "polarization data", "spectrum", etc. An additional 3% of the entries are in five commonly used units (B, E, F, I, X). The remaining 2% of the entries are in less popular units which are dimensionally equivalent to one of the more commonly used units above. Magnitude units are relative and the original article should be consulted for the appropriate conversion factor. In general, infrared magnitudes are calibrated with respect to the flux density of α Lyr (10^4 °K blackbody) which is defined as being 0.0 magnitude at all infrared wavelengths (see Gillett *et al.* (1971), *Ap. J., 164,* 83; Gehrz and Woolf (1971), *Ap. J., 165,* 185). The following symbols sometimes occur next to values in the "FLUX" column: V = variable, (or mean of several values), L = lower limit (detector saturated), and E = Editors determined flux from maps, spectra, or other material in the article presented in non-tabulated form. When spectral data (S) is listed, only the starting wavelength of the spectrum is given in the "λ (μm)"

column. Starting and ending wavelengths of published spectra are given in Appendix D. A question mark (?) is used to indicate that the published value is not consistent with other observations.

BEAM SIZE - "BEAM": The angular beam size of the observation is presented in degrees (°), arc minutes (') or arc seconds ("). If no beam size information was given in the original reference, a dash (–) is entered. In addition to being a factor in source brightness calculation, the beam size can be used as an aid in determining positional coincidence and identifications with other sources, and as a first-order indication of positional uncertainty.

BIBLIOGRAPHIC REFERENCE - "BIBLIO": The bibliographic reference number indicates the original journal reference for each observation in the catalog, and is keyed to the *Bibliography of Infrared Astronomical Literature* in Appendix B. Thus, each observation can be quickly traced to its original source. The bibliographic reference number is made up of the year and month of publication, and a sequential number assigned to the article (for example "790104" is broken down into 79-01-04, where 79 = 1979, 01 = January, and 04 = article #4 in that month). References used in the data base, but not containing infrared information, have an "89" or "99" as the month of publication. An "89" means that the reference was published in the 1800s. References which do not indicate the month of publication have "00" in the month field.

IRAS DATA - "IRAS": The IRAS PSC data are presented in a special compact format in two columns in the CIO listings (Part I), and in complete detail in the appendix *IRAS PSC Data for CIO Sources* (in Part II). For each CIO listing the corresponding IRAS name and fluxes are given using four digits, representing the approximate logarithm of the flux density in each of the four IRAS bands. For example "0 0 1 2" means that the source listed has fluxes of *roughly* 1, 1, 10, and 100 Janskys in IRAS Bands 1, 2, 3, and 4 (12, 25, 60 and 100 microns), respectively. The range of the numbers used in this notation are specifically 0 = 0.5 - 5 Jy, 1 = 5-50 Jy, 2 = 50-500 Jy, 3 = 500-5000 Jy, etc. This allows the user to get an immediate estimate of the IRAS PSC fluxes in a quick, easy to read format. The abbreviated IRAS flux values listed in *italics* are upper limits in the IRAS data. The *IRAS PCS Data for CIO Sources* appendix gives the IRAS position and full accuracy IRAS PSC flux in each band, keyed to and arranged numerically in order of the IRAS name. Also, IRAS data were included in the main catalog listings whenever an IRAS source was referred to in the literature, even if no new observations were published. The editors felt that this would provide a connection between the IRAS data base and this summary of current observational research activity.

ACKNOWLEDGEMENTS

The editors are grateful to Dr. Michael Hauser and Dr. Nancy Boggess for their support of the catalog data program. We would like to thank Dr. Wayne H. Warren Jr. (National Space Science Data Center) for help in obtaining positional data to supplement the literature search and for useful discussions regarding data base management and procedures. Dr. Chas. Beichman was particulary helpful in questions concerning the IRAS mission. Data entry, proofreading, and software support were provided by C. Aquirre-Echevarria, M. Butschky, J. Garner, S. Hammer, G. McKim, and J. Wilding. We thank Sidney Nichols and Edwin Treine of the Government Printing Office for their important contributions to the production of this volume, the computer typesetting of the Catalog listings and Appendices. This work is supported by the National Aeronautics and Space Administration, NASA/Goddard Space Flight Center, and NASA contract NAS 5-29375.
